

Dye Tracer Study at South Shore Beach

Week of September 23, 2013

(Tentatively scheduled for Friday, September 27th)

The McLellan Laboratory from UWM-School of Freshwater Sciences is conducting a study using a **fluorescent green non-toxic dye** to evaluate shoreline water residence times at the current beach site and at a proposed beach site on the south side of the jetty.

The dye breaks down quickly and will be gone by late afternoon on the day of the test. There will be someone on site to answer any questions –

Thanks!
